Web-based client server system with thin client architecture for
enterprise *applications*, has object manager interposed between client
and application server with business/objects and components

Patent Assignee: SIEBEL SYSTEMS INC (SIEB-N)

AU 200018382 A G06F-017/30 Based on patent WO 200033217

Abstract (Basic): WO 200033217 A1

Abstract (Basic):

NOVELTY - The object manager is interposed between thin client (15)
and application server comprising business objects, business components
and database server. The object manager run time engines enforce
repository defined business processes and rules. Session based network
protocols connect client to object manager.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for
the method of connecting client and server in a client server network.

USE - For transferring *service* requests and responses between
thin client and enterprise server, in client-server system for business
applications.

ADVANTAGE - The thin client can be adapted to the existing
interface, without necessitating redesigning or reprogramming of user
interface. Since the web-based thin client application can be executed
on shared servers, the computing resources can be efficiently used by
all users in the enterprises, and need for upgrading each desk top is
eliminated. Enables to deliver information from server to client, in
suitable manner, minimizing the number and size of communications
between client and server. The client-side user interface uses minimum
amount of RAM and CPU and can be accessed from any connected machines.

DESCRIPTION OF DRAWING(S) - The figure shows the platform for
web-based client server system.

configurations and rules. The integration *service* system comprises a data transformation engine and rules evaluation engine which uses data transformation configurations and rules stored in the database. This *service* system splits or combines messages from the enterprise messaging system and performs routing of messages to computer applications. INDEPENDENT CLAIMS are also included for the following:

- (a) improved *enterprise* *application* integration system;
 - (b) method for message transmission between two computer applications;
 - (c) agent adaptor for use in *enterprise* *application* integration system;
 - (d) *enterprise* *application* integration system
- USE - For industries, organizations.

ADVANTAGE - Improves message tracking and manipulations. Enhances security features such as authentication, authorization, privacy, non-reputation and auditing. Facilitates fast and simple integration of leading ERP applications, custom applications, packaged applications and database, and eliminates need for expensive custom coding. Aids long term reliability, scalability, flexibility and extensibility needed by enterprises. Enables enterprises to leverage existing IT investments, increase speed to market, implement solutions and realize benefits. Provides faster access to customer and billing information, thereby enabling enterprise to offer effective *service* to customer. Simplifies enterprise IT architecture and provides central point of integration for all applications and platforms, thereby providing efficient and cost effective information sharing.

DESCRIPTION OF DRAWING(S) - The figure shows block diagram of agent adaptor.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
JS 5996012	A	14	G06F-013/38	

Abstract (Basic): US 5996012 A

Abstract (Basic):

NOVELTY - An application comprising a profile object and a database with configuration information to be applied to endpoint object, is generated using a prototype data, which is in ASCII text file format. The generated application is evaluated and refined based on the evaluation.

DETAILED DESCRIPTION - The end point object is controlled to apply end point data by control information. The database records are passed to end point object which performs configuration changes to conform set of end point data to database records. An INDEPENDENT CLAIM is also included for configuration management application development computer program product.

USE - In distributed computer enterprise environment.

ADVANTAGE - Quality and consistency of configuration management *applications* in distributed *enterprise* is improved. Abstract, architecture-and-platform-independent profiles which describe configuration settings for resources and *services* is create. Programmers are assisted to build distributed applications that are useful in controlling configuration of many systems in distributed computer enterprise.

DESCRIPTION OF DRAWING(S) - The figure shows the flow chart illustrating method of configuration management application development.
